Another consists of 10,000 samples. I am not sure how to get the size of the larger dataset. I have to add the two data sets together, and I know that the number of samples in the smaller dataset is the same as the number of samples in the larger dataset minus the size of the smaller dataset, but that doesn't give me an exact number of samples. I have tried this: size=len(A_max) size = len(A_max)-len(B_min) And also, size=len(A_max) size = len(A_max)-len(A_min) But neither of those worked. A: You are calculating the size of A_max. size=len(A_max) size = len(A_max)-len(A_min) They are not. len() returns the length of the string or list. To calculate the size you can use size(A_max). You can also write it as len(A_max) - len(A_min). Or if you want it in another form you can use a list comprehension: size = len([i for i in A_max if i!= A_min]) You can also use A_min.setdiff1() A: A_max=set(A_max) - A_min = all values in A_max except the values in A_min A_max = list(A_max) # to make it a list size = len(A_max) - len(A_min) Q: XmlSerializer
